TWRS PHASE I INFRASTRUCTURE PROJECT (W-519) CHARACTERIZATION

1.0 INTRODUCTION

In order to treat the mixed radioactive and hazardous waste stored in 177 underground tanks, the Tank Waste Remediation System (TWRS) program is developing a "demonstration" site for treatment and immobilization of these wastes by a private contractor. Project W-519 is providing the infrastructure support to this site by developing the designs and emplacing required pipelines, roads, electrical, etc. In support of the TWRS Phase I Infrastructure Project (W-519) Characterization, Numatec Hanford Corporation (NHC) contracted with Waste Management Federal Services, Inc., Northwest Operations (WMNW) to investigate a number of locations in and just outside the 200 East Area eastern fenceline boundary. These areas consisted of known or suspected waste lines or waste sites that could potentially impact the construction and emplacement of the proposed facility improvements, including waterlines and roads. These sites were all located subsurface and augering would be required to obtain sample material from the desired depth. The soils would then be sampled and submitted to the laboratory for analysis of radioactivity.

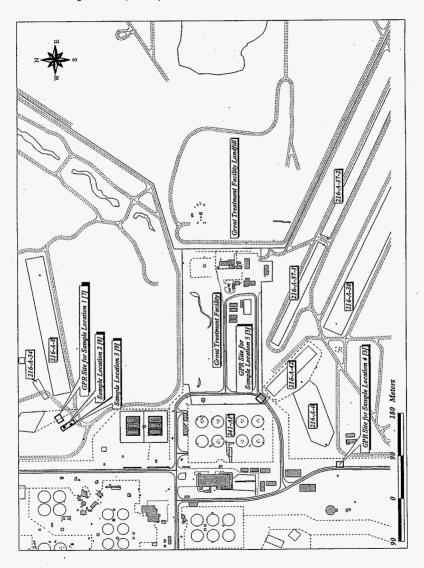

2.0 PROJECT SCOPE

After reviews of the site, historical documents, and site maps, including a complete site walkdown, it was determined that five locations (see Figure 1; the numbers in brackets represent the original planning designations) would be designated for augering and sampling. Field work was directed by a statement of work (SOW) developed by NHC personnel. At three of these locations, the site was staked out in a 50 ft by 50 ft grid marked off on 5 ft centers. Sites 2 (8) and 3 (9) were conducted along a single 30 ft x 200 ft grid. Each location was subject to a Ground Penetrating Radar (GPR) survey. Each of the grids was permanently located using the Global Positioning System (GPS). One sample was collected from the desired depth ranging from 5 ft to 8 ft below existing grade. The samples were monitored by a Health Physics Technician (HPT), released, and submitted to the Waste Sampling and Characterization Facility (WSCF) laboratory for analyses of total alpha, total beta, and gamma spectroscopy.

3.0 GROUND PENETRATING RADAR

3.1 INTRODUCTION

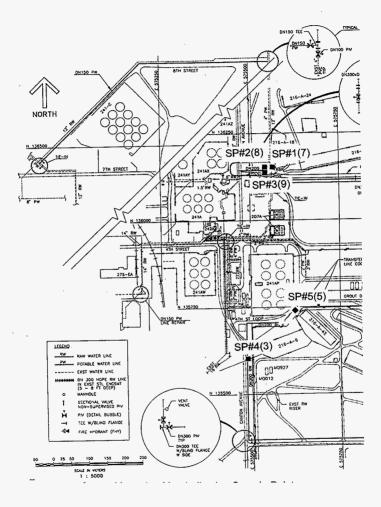

WMNW provided a subcontract to CH2M Hill to conduct GPR investigations of five sites in support of the TWRS Phase I Infrastructure Characterization (Figure 2). The five sites were where the soil was to be sampled using a drilling auger. Figure 3 is a summary of the investigation parameters.

Figure 3. GPR Investigation Summary.

Sites: Sample Point #3, Sample Point #5, Sample Point #7, Sample Point #8, and Sample Point #9. Document Number: None Date: June 1998 Sponsor (Contact, phone): Ron Mitchell (WMFSI) 509-376-5122 Investigators (Name, Company, Phone, E-mail): Tom Mitchell & Kevin Bergstrom CH2M Hill 509-372-9690 (Thomas H Mitchell@RL.gov), 509-372-9591 (Kevin A Bergstrom@RL.gov) Location: All in 200 East Area, Hanford Site, Richland, WA. Sample Point #3- East side of Canton Ave., south of 241-AP Tank farm Sample Point #5- Between 241-AP tank farm and 216-A-42 trench on 4th Street. Sample Point #7- East of tank farm 241-AX and south of 216-A-24 crib, outside of the perimeter fence. Sample Point #8- East of tank farm 241-AX and south of 216-A-24 crib, outside of the perimeter fence. Sample Point #9- East of tank farm 241-AX and south of 216-A-24 crib, outside of the perimeter fence. Objectives: To locate underground utilities, pipelines, or any other subsurface features that might impact the sampling with a cone penetrometer. Site Description Cultural Resource Setting: NA Torrain SP#3 - Flat gravel surface. SP#5 - Primarily flat asphalt with a "2-ft deep ditch on the southeastern edge of the road and minor undulations immediately north of the road. SP#7- The grid is centered on a east-west trending 3-4-ft high berm. The crest is at ~ N175. SP#8- The grid is centered on a east-west trending 3-4-ft high berm. The crest is at " N175. SP#9- The grid is centered on a east-west trending 1-2-ft high berm. The crest is at ~ N120. Vegetation: SP#3 - None SP#5 - None SP#7- Minimal, scattered tumble weed, cheat grass, and rabbit brush. SP#8- Minimal, scattered tumble weed, cheat grass, and rabbit brush. SP#9- Minimal, scattered tumble weed, cheat grass, and rabbit brush. Hydro Properties (water table, moisture etc.): All sites- Very dry, depth of investigation was entirely within the vadose zone. Soil/sediments/rock type: All sites - Eolian sand with scattered gravel/cobbles Anticipated Bedrock (depth and type): NA Obstacles (rocks, trees, buildings etc): SP#3, 7, 8, and 9 - none SP# 5 - Steep 3-ft bank just outside the grid along E150. Site limitations: None Overall assessment of site for geophysical investigations: GPR was effective to depths of 0-10-ft at all five sites. Equipment:

Type/model: GSSI SIR10A ground penetrating radar system. All data were collected with a GSSI 300 MHZ model 3105 antenna. All hard copies were made with a GS-608P Plotter. Data format (tape/disk/hardcopy): Hard copies on file.

Survey Parameters/grid:

Data Collection Parameters:

A 5x5-ft grid was established at each site. Blue stakes were placed at the corner of each grid. Data were collected along parallel profiles spaced 5 feet apart in two orthogonal directions. WMFSI personnel surveyed the grids with a global positioning system (GPS).

Equipment Settings:

Range 108 ns: Scans/second- 25: Sample/scan 512

Continuous data collection: Signal gains and filtering were performed in the field. No post processing of the data was performed.

3.2 OBJECTIVES

The primary objectives of the GPR investigation were:

- To locate and map subsurface utilities and other buried anthropogenic material that might interfere with the sampling.
- To identify alternative sites for sampling if the pre-selected sites had subsurface obstructions.

3.3 GROUND-PENETRATING RADAR METHODOLOGY

The GPR system for this work utilized a 300-megahertz (MHz) transducer. The transducer transmits electromagnetic energy into the ground. Buried objects such as pipes, barrels, foundations, and buried wires can cause all, or a portion, of the transmitted energy to be reflected back towards a receiving antenna. Geologic features such as cross bedding, caliche horizons, paleosols, and clays can also cause reflections of the transmitted energy. The reflected energy provides the means for mapping the subsurface features of interest, whether man-made or geologic.

The maximum depth of investigation varies from site to site, and is a function of the transmit power, receiver sensitivity, frequency of the antenna, and attenuation of the transmitted energy. The attenuation of the energy is primarily a function of the local soil conditions. Depth of investigation is also affected by highly conductive material, such as metal drums and pipes, which essentially reflect all the energy. The method cannot "see" directly below areas of highly reflective material since "all" of the energy is reflected. The maximum depth for usable data was about 14 ft below the surface for these surveys.

Display and interpretation of GPR data are similar to that of seismic reflection data (i.e. data displayed as horizontal distance versus time, depicting pseudo cross-sections of the earth). Figure 4 is an example of a typical GPR profile, taken from the sample point #3 site. The approach to an interpretation can be variable and influenced by the objectives of the survey and the experience of the interpreter. Numerous data processing techniques are available that may or may not aid in the interpretation process. In some areas, interpretations can be straight forward, but often a highly variable subsurface yields complex data that is difficult to interpret. The end product, in these surveys, is a plan view map showing the location and depth of features that were detected within the survey area.

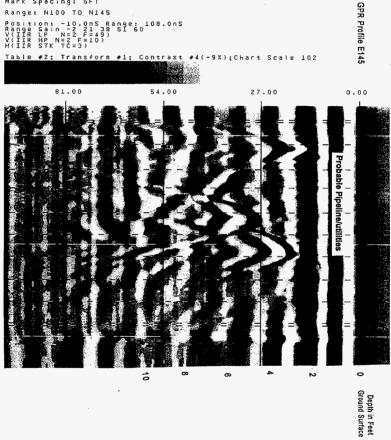

The GPR data were collected with a Geophysical Survey Systems Inc. (GSSI) Subsurface Interface Radar (SIR)¹ System 10A Plus with a recording window of 108 nanoseconds, two-way travel time. A 300 MHz, model 3105 antenna was used.

3.4 RESULTS

Several linear anomalies were detected at the Sample Point #3 site that have the characteristics of buried utilities or pipelines. The staked sample point was very near an east west trending linear (Figure 5). It was recommended that the sample point be moved a few feet to safely avoid the linear if the risk of inadvertent contact is important. Several isolated anomalies were also detected at Sample Point #3. The majority of these anomalies were located in the northern and eastern portion of the survey grid and should be avoided if possible.

Table #2; Transform #1; Contrast #4(-9%);Chart Scale 102

9

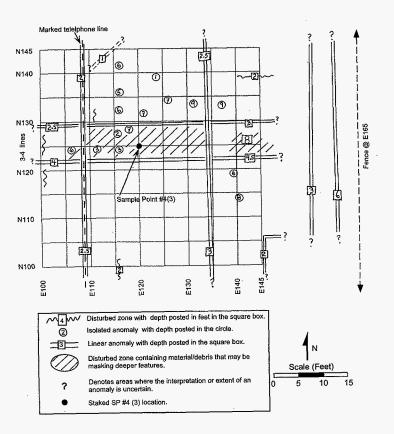

Figure 6 shows the results of the GPR survey at Sample Point #5. Four distinct linears were identified. All linears, isolated anomalies, and disturbed zones should be avoided when selecting the final sample point if inadvertent contact is to be avoided.

Figure 7 shows the results of the GPR survey conducted at Sample Point #7. The staked sample point was within 1-2 ft to a linear anomaly that has the characteristics of a buried pipeline or utility.

A single grid system was used that incorporated both Sample Point #8 and Sample Point #9 (Figure 8). Two linears were detected, one near each sample point. Sample Point #9 is in a disturbed zone that may contain anthropogenic material that could effect the sampling at the site.

4.0 GLOBAL POSITIONING SYSTEM INFORMATION

4.1 GPR GRID LOCATIONS

GPR operators using standard measuring techniques (i.e., tape measure) prepared the GPR grids. A global positioning system operator then collected geographic data pertaining to the corners of these grids using a survey quality GPS, capable of 2 cm (0.8 in.) accuracy in real time. These data were transferred to a personal computer with software designed to process and assess the quality of the GPS data. This software was also used to convert the raw GPS data into the Washington State Plane, North American Datum (NAD) 83-91 coordinate system as required by state and federal regulations. Once the data had been processed and approved, it was exported to an ASCII comma delimited file for use in conventional software programs (i.e., Microsoft² Excel and Word) for reporting and to use in Geographic Information System (GIS) software to prepare scale maps of the GPR locations.

5.0 DRILLING FIELD ACTIVITIES

5.1 PRELIMINARY FIELD ACTIVITIES

Field inspections were completed prior to on-site drilling activities. Prior to initiating field work, excavation permits, cultural and biological resource reviews, start cards, etc. were obtained (see Attachments A through H). These field inspections provided information supporting preliminary documentation and planning.

Boring designations were obtained for five (5) geotechnical borings (B8701 through B8705).

5.2 FIELD ACTIVITIES

5.2.1 Drilling

Drilling commenced on June 10, 1998 and was completed on June 11, 1998. A SIMCO model 2400 auger drill (gasoline over hydraulic) was used in conjunction with 8 in. O.D. solid stem augers.

The following describes boring reference numbers:

- 1. Site 1, B8701 (boring designation), planning number 7;
- 2. Site 2, B8702 (boring designation), planning number 8;
- 3. Site 3, B8703 (boring designation), planning number 9;
- 4. Site 4, B8704 (boring designation), planning number 3; and
- 5. Site 5, B8705 (boring designation), planning number 5.

Drilling details such as duration, sample times, and methods were documented in the Samplers Logbook (reference WM-SML-H13). A discussion on site specific operations is as follows:

 Site 4 (sample point 3, B8704): June 10, 1998. A Pre-Job Safety meeting was held; the auger unit was set-up and drilling initiated at 08:50; an auger flight was added to the drill string at 09:04; sample depth achieved (7 ft below land surface [BLS]) at 09:08; drilled to a depth of 8 ft BLS and a sample obtained (09:18) by pulling flights up. Sample interval 7 ft to 8 ft BLS.

A soil change was noted from ~6 ft to 8 ft BLS. The soil change consisted of a washed medium/coarse grained sand.

Upon removal of the auger flights, the boring was backfilled and slightly compacted with previously excavated (drilled) soil. The flag locator was placed at the boring location.

No contamination was noted with field instrumentation. Background was noted at 100 cpm/PA Beta/Gamma.

Visitors on location were Mr. William Hopkins and Mr. Ted Perry with the water utilities department. The Water utilities personnel viewed drilling operations at Site 4, since a water line was located to the East of the boring location.

The sampling Team consisted of Mr. Karl Hulse (Scientific Technician), Mr. Laurence Corgatelli (Health Physics Technician), Mr. Ron Mitchell (Project Manager) and Mr. Dave Skoglie (Drilling Engineer).

 The Original plan was to drill boring B8705 (Site 5, sample point 5); however, the electrical utilities planning department could not fit us in their schedule for the 10th of June. Prior arrangements had been made with the utilities department. Electrical utilities will turn-off power to R0600 2,400 volt lighting line) the 11th at 08:00.

Site 3 (sample point 9, B8703): The auger unit was set-up and drilling initiated at 10:15; sample depth achieved (4 ft BLS) at 10:20; drilled to a depth of 5 ft BLS and a sample obtained (10:23) by pulling flights up. Sample interval 4 ft to 5 ft BLS.

A soil change was noted from ~4 ft to 5 ft BLS. The soil change consisted of a light colored fine grained sand.

Upon removal of the auger flights, the boring was backfilled and slightly compacted with previously excavated (drilled) soil. The flag locator was placed at the boring location.

No contamination was noted with field instrumentation. Background was noted at 100 cpm/PA Beta/Gamma.

No visitors were on location.

The sampling Team consisted of Mr. Karl Hulse (Scientific Technician), Mr. Laurence Corgatelli (Health Physics Technician), Mr. Ron Mitchell (Project Manager) and Mr. Dave Skoglie (Drilling Engineer).

 Site 2 (sample point 8, B8702): The auger unit was set-up and drilling initiated at 10:37; sample depth achieved (4 ft BLS) at 10:42; drilled to a depth of 5 ft BLS and a sample obtained (10:45) by pulling flights up. Sample interval 4 ft to 5 ft BLS.

A soil change was noted from ~4 ft to 5 ft BLS. The soil change consisted of a light colored fine grained sand.

Upon removal of the auger flights, the boring was backfilled and slightly compacted with previously excavated (drilled) soil. The flag locator was placed at the boring location.

No contamination was noted with field instrumentation. Background was noted at 100 cpm/PA Beta/Gamma.

No visitors were on location.

The sampling Team consisted of Mr. Karl Hulse (Scientific Technician), Mr. Laurence Corgatelli (Health Physics Technician), Mr. Ron Mitchell (Project Manager) and Mr. Dave Skoglie (Drilling Engineer).

4. Site 1 (sample point, B8701): The auger unit was set-up and drilling initiated at 10:50; sample depth achieved (5 ft BLS) at 11:01; drilled to a depth of 5 ft BLS and a sample obtained (11:04) by pulling flights up. Sampling interval 5 ft to 5.75 ft BLS.

A soil change was noted from ~5 ft to 5.75 ft BLS. The soil change consisted of a light colored fine-grained sand.

Upon removal of the auger flights, the boring was backfilled and slightly compacted with previously excavated (drilled) soil. The flag locator was placed at the boring location.

No contamination was noted with field instrumentation. Background was noted at 100 cpm/PA Beta/Gamma.

No visitors were on location.

The sampling Team consisted of Mr. Karl Hulse (Scientific Technician), Mr. Laurence Corgatelli (Health Physics Technician), Mr. Ron Mitchell (Project Manager) and Mr. Dave Skoglie (Drilling Engineer).

 Site 5 (sample point 5, B8705): June 11, 1998. The Electricians met with Mr. Skoglie at the breaker location in 200 East. The Electricians de-energized the RO600 lighting line and tagged out the system. Mr. Skoglie notified the dispatcher and overtagged the system. The electricians viewed the boring location and verified the lighting line.

The auger unit was set-up and drilling initiated at 08:27; an auger flight was added to the drill string, sample depth achieved (5 ft BLS) at 08:41; drilled to a depth of 6 ft BLS and a sample obtained (08:50) by pulling flights up. Sampling interval 5 ft to 6 ft BLS.

A soil change was noted from ~5 ft to 6 ft BLS. The soil change consisted of a light colored fine-grained sand.

Upon removal of the auger flights, the boring was backfilled and slightly compacted with previously excavated (drilled) soil. The flag locator was placed at the boring location.

No contamination was noted with field instrumentation. Background was noted at 100 cpm/PA Beta/Gamma.

No visitors were on location. However, adjacent to the work location were two operators watching the sampling operation (~08:35). No comments were made to Mr. Hulse whom initiated discussions with the Operators.

The sampling Team consisted of Mr. Karl Hulse (Scientific Technician), Mr. Laurence Corgatelli (Health Physics Technician), and Mr. Dave Skoglie (Drilling Engineer).

6.0 SAMPLING ACTIVITIES

6.1 SAMPLING PREPARATION

In support of Phase 1 Privatization Site Infrastructure (W-519) sampling containers and laboratory provided Petri dishes meeting U.S. Environmental Protection Agency (EPA) Level 1 cleanliness guidelines were selected for this project. Each container had been bar coded with a lot and serial number (provided by the manufacturer). Certificates of analysis verifying the cleanliness of the containers by lot are maintained by Sampling Services in accordance with SML-EP-001, Section 1.3, "Control of Certificates of Analysis." Types of containers and lot numbers are listed in the field logbook (WM-SML-H13, pages 77-82) and are contained in this document (Attachment H).

The work plan for Phase 1 Privatization Site Infrastructure specified that stainless steel sampling equipment be cleaned in accordance with SML-EP-001, 2.5, Rev. 0 "Laboratory Cleaning of Sampling Equipment." All stainless steel bowls and spoons were cleaned to this procedure prior to deployment to the field.

6.2 SAMPLING ACTIVITIES

Sampling activities were conducted at the designated sites from June 10-11, 1997. Sampling was performed in accordance with SML-EP-001, 4.1, Rev. 0, "Soil and Sediment Sampling." A list of the sample site locations, corresponding sample identification numbers, collection dates and times, and the analytical laboratory are provided below.

Sample #	Sample Site	Borehole #	Sample Depth	Date	Time	Lab
S8091-01	1 [7]	B8701	5 ft-6 ft	6-10-98	1104	WSCF
S8091-02	2 [8]	B8702	4 ft-5 ft	6-10-98	1045	WSCF
S8091-03	3 [9]	B8703	4 ft-5 ft	6-10-98	1023	WSCF
S8091-04	4 [3]	B8704	7 ft-8 ft	6-10-98	0918	WSCF
S8091-05	5 [5]	B8705	5 ft-6 ft	6-11-98	0850	WSCF

Table 2	2. Sam	pling A	Activit	ies for	Desi	gnated	Sites.

WSCF = Waste Sampling and Characterization Facility.

A map of sample locations are in the Field logbook (WM-SML-H13, pages 77-82) and are attached to this document (Attachment H).

6.3 SAMPLING METHOD

A SIMCO model 2400 auger drill with a 8 in. outside diameter solid stem auger was used to reach the desired sample depth. When the Auger reached the sample depth the auger was raised the flights were cleaned of soil and the auger was lowered back into the hole and drilled an additional foot. The auger was then raised were the sample was collected from the lower flights with a cleaned stainless steel spoon and bowl.

Samples were shipped to the WSCF by government vehicle in a sealed ice chest, packed on wet ice.

6.4 POST-SAMPLING ACTIVITIES

Chain of Custody (COC) #101078 was used to maintain custody on all samples and maintained in accordance with SML-EP-001, 1.1, "Chain of Custody/Sample Analysis Request." The COC was maintained from the sample collection site through delivery of the samples to the Laboratory. Samples were delivered to the laboratory on the final day of collection. Samples from the previous day were stored overnight in a refrigerated custody locked storage area (6269 Building) maintained by Sampling Services.

Field logbook WM-SML-H13 was used in accordance with SML-EP-001, 1.5, "Field Logbooks" to document all sampling activities.

7.0 DATA EVALUATION

Analytical data were received form the WSCF laboratory and the complete data set is included in Attachment G. All of the values for total alpha and total beta were below the minimum detection limits for the laboratory and showed up as "undetected" by the result qualifier.

For the gamma spectroscropy, all of the radioanalytes were below the minimum detection limits and were designated as "undetectable," with the exception of ¹³⁴Cs. However, the WSCF lab has since determined that the reported ¹³⁴Cs values are invalid and represent naturally-occuring

radionuclides, such as thorium. Therefore, no radionuclides were detected in the samples above the detection limits. The average value reported for ¹³⁷Cs in the 200 Area surface soils for the near-facility monitoring in 1997 was 1.8 E+00 pCi/g.

8.0 CONCLUSIONS

Based on the results of the field characterization efforts and analytical data, some general conclusions can be made regarding the project locations investigated. The data collected represent a good "snapshot" of conditions where a high probability of radioactive contamination would have been expected. However, sampling methods by their very design do not provide detailed information on every aspect of the proposed site. Unanticipated field conditions during construction can occur and should probably be expected within the 200 Areas where 50 years of waste operations activities, changing environmental conditions, and current cleanup operations affect these sites on a daily basis. The conclusions reached to date include the following:

- There should be limited potential for contamination at the proposed construction depth inside a 3 to 5 ft radius from identified structures where boreholes were completed.
- The above statement is an extrapolation of evidence from previous studies on the 200 Areas plateau of the Hanford Site that indicate that leaks, spills, etc., generally move through the sandy soils in a roughly spherical pattern. Localized soil anomalies, however, could be expected to affect this process.
- Data from a single borehole which indicates a lack of contamination at, or near, a known disposal site should not be construed to mean that the site is entirely free of contamination.
- The borehole location represents only one of the four compass points around any
 particular underground facility. This should be kept in mind during construction
 planning.
- Comprehensive health and safety guidelines should be delineated for workers included in construction activities, with special consideration given to any and all areas around the boreholes investigated during this study, or to any other underground structures or utilities.
- Any of the above conclusions can be obviated by anomalous conditions not encountered during the characterization study, by ongoing or new construction or operational activities which may impact the proposed route, and by constantly changing environmental conditions which could affect the movement of contaminants away from the waste site during the period from finalization of this characterization effort to project completion.

JOB HAZARD CONTROLS CHECKLIST

For each item checked "yes" on Hazards Analysis, complete a box below outlining the primary control measures to mitigate/control health & safety hazards. When an item is a non-hazard program or procedural requirement, then provide applicable information.

ELECTRICAL: Power lines are within 20 ft of the sample location (numbers 5 and 6). The electrical utilities will be contacted and power turned off if required.

MANUAL LIFTING: Use proper lifting techniques (bend knees, straight back, firm grip on load). Use buddy system for heavy/bulk/awkward loads.

PINCH POINTS/GUARDING: Wear sturdy leather work gloves when handling equipment and tools. Assure all guards are in place and functional. Be watchful of moving parts and other potential pinch points.

WALKING SURFACES: Wear substantial footwear with lugged or other non-slip sole. Be careful of equipment on the ground. Keep work area picked up.

EXCAVATION: An approved Excavation Permit, with appropriate signatures, is needed prior to drilling operations.

OVERHEAD HAZARDS: Level D PPE is required. Be aware of overhead operations.

FALLING OBJECTS: Level D PPE is required. Conduct weekly and monthly Checklist for drill unit/pump setting rig.

SANITATION: Have wash water, soap and towels available. Know the location of the nearest portable toilet or restroom.

HAZARD COMMUNICATION: OSHA 1910.1200 hazard communication will be posted at the 600 Area Pipeyard for employees.

NOISE: Wear hearing protection when drill unit, work-over unit, support equipment is operating. Post work area "Hearing Protection Required."

DUST: During dust storms that create a hazardous work environment, work will STOP.

TEMPERATURE EXTREMES: Wear clothing appropriate for prevailing weather conditions. Know the symptoms of heat/cold stress and monitor each other for symptoms. Have plenty of drinking water available during hot weather and encourage frequent water consumption. Have shaded/warming areas available for rest breaks, depending on conditions.

CHEMICALS: Develop and maintain an MSDS file for ready reference of all chemicals and chemical products used on the job (ie; oils, lubes and fluids). Secondary containers will be labeled appropriately.

BIOLOGICAL HAZARDS: Be watchful for poisonous reptiles/insects around work area, particularly beneath equipment that has rested on the ground over night and in shaded areas beneath shrubs. Watch where you reach! If encountered, do not attempt to handle reptiles or insects. Contact BHT animal control at 373-1383/331-0719.

RADIOLOGICAL HAZARDS: Red Con will evaluate data to determine necessary protocol. A Radiation Work Permit will be developed if contamination levels are reached beyond set limits.

DRILLING: Be aware of rotating pipe (stand clear) it can grab. Be aware of pinch points.

SITE CONTROL: Demarcate work area by use of traffic cones and/or a rope boundary. Post work area for PPE requirements. Keep unauthorized personnel away from operating equipment. A map is attached for access/egress.

FLAMMABLE/COMBUSTIBLE MATERIALS: Store in appropriate and labeled containers.

2

SHARP OBJECTS: Be aware of sharp objects and wear gloves.

GUARDING: All guards must be in place and secure.

HAND TOOLS: Inspect tools before use. Replace defective/worn tools. Use correct tool for the task. Do not attempt to modify tools.

FIRST AID: Supervisor and at least one additional crew to be first Aid/CPR trained. First aid kit shall be available on job. See Page #4 for emergency phone numbers.

EMERGENCY CONTROLS: Emergency Control contacts are Dan Edwards (372-2429) or Marty Gardner (372-8029). A radio and/or cellular phone will be onsite and operational at all times.

PERMITS: RWP, as determined by Radcon. Excavation permit, Biological and Cultural reviews.

TRAINING: (1) Operators to be qualified to operate associated equipment, i.e., SIMCO auger dirll, sampling equipment, and support equipment. (2) Crew to read and acknowledge the AHA governing activity. (3) Hearing conservation and baseline audiogram. and (4) Conduct and document Pre-Job Briefing prior to start of activity and daily Safety Briefing.

Biological and Cultural Reviews.

Pacific Northwest National Laboratory Operated by Battelle for the U.S. Department of Energy

iperated by Battelle for the U.S. Department of Energy

May 26, 1998

No Known Historic Properties

Mr. D. E. Skoglie Waste Management Federal N. W. P. O. Box 650/H1-12 Richland, WA 99352-0650

Dear Mr. Skoglie: CULTURAL RESOURCES REVIEW OF THE W-519 SAMPLING PROJECT. HCRC #98-200-059.

In response to your request received May 22, 1998, staff of the Hanford Cultural Resources Laboratory (HCRL) conducted a cultural resources review of the subject project, located in the 200 East and 600 Areas of the Hanford Site. According to the information that you supplied, the project will entail drilling 5 geotechnical auger borings in order to test for radiological contamination adjacent to pipelines. The borings will be less than 20 feet in depth and approximately 8 inches in diameter. No site preparation is needed prior to drilling with the chain auger. The sampling locations will be in graveled oxpreviously excavated areas.

Our literature and records review shows that the borings will be located in industrial areas of the 200 East and 600 Areas in ground that has been disturbed by previous Hanford Site construction activities. It is unlikely that any intact archaeological materials will be affected by the proposed project. Survey of the project area and monitoring of the excavations by an archaeologist are not necessary.

It is the finding of the HCRL staff that there are no known cultural resources or historic properties within the proposed project area. The workers, however, must be directed to watch for cultural materials (e.g., bones, artifacts) during all work activities. If any are encountered, work in the vicinity of the discovery must stop until an HCRL archaeologist has been notified, assessed the significance of the find, and, if necessary, arranged for mitigation of the impacts to the find. The HCRL must be notified if any changes to project location or scope are anticipated. This is a Class III case, defined as a project which involves new construction in a disturbed, low-sensitivity area.

Copies of this letter will be sent to D. W. Lloyd, DOE, Richland Operations Office, as official documentation. If you have any questions, please call me at 376-8107. Please use the HCRC# above for any future correspondence concerning this project.

Very truly yours,

N. A. Cadoret Technical Specialist Cultural Resources Project

Mr. David Skoglie Waste Management Northwest P. O. Box 650, MSIN H1-12 Richland, WA 99352

Dear Mr. Skoglie:

BIOLOGICAL REVIEW FOR THE W-519 SAMPLING PROJECT, 200 East Area, #98-200-059

Project Description:

 Drill 5 shallow (< 20' in depth) geotechnical auger borings in graveled or previously excavated areas.

Survey Objectives:

- To determine the occurrence in the project area of plant and animal species protected under the Endangered Species Act (ESA), candidates for such protection, and species listed as threatened, endangered, candidate, sensitive, or monitor by the state of Washington, and species protected under the Migratory Bird Treaty Act,
- To evaluate the potential impacts of disturbance on priority habitats and protected plant and animal species identified in the survey.

Survey Methods:

- Pedestrian and ocular reconnaissance of the sites proposed for the 5 geotechnical auger borings was conducted by M. Sackschewsky, C. Duberstein, and J. Becker May 26, 1998.
- Priority habitats and species of concern are documented as such in the following: Washington Department of Fish and Wildlife (1996, 1998), Washington State Department of Natural Resources (1997), and for migratory birds, U.S. Fish and Wildlife Service (1985). Lists of animal and plant species considered Endangered, Threatened, Proposed, or Candidate by the USFWS are maintained at 50 CFR 17.11 and 50 CFR 17.12.

Survey Results:

- All of the sites proposed for the 5 geotechnical auger borings have been previously disturbed and are occupied by weedy vegetation consisting largely of Russian thistle (Salsola kalt).
- No avian use of the sites proposed for the 5 geotechnical auger borings was observed.

902 Battelle Boulevard = P.O. Box 999 = Richland, WA 99352

Mr. David Skoglie 98-200-059 Page 2 of 2

Conclusions and Recommendations:

- No plant and animal species protected under the ESA, candidates for such protection, or species listed by the Washington state government as threatened or endangered were observed in the vicinity of the sites proposed for the 5 geotechnical auger borings.
- No adverse impacts to species, habitats, or other biological resources are expected to result from the proposed action.
- This Ecological Compliance Review is valid until 15 April 1999.

Sincerely. C. A ckon

CA Brandt, Ph.D. Project Manager Ecological Compliance Assessment

SUBJECT: Waste Management Support for TWRS Infrastructure W519 Characterization Project

In general, soil removed from a contaminated area for investigative purposes can be returned to that area. This doesn't mean that soil from an adjacent area can be dumped. It means that soil removed from a specific area for sampling, etc., can be returned to that specific area, given that no increased potential for site contamination or personnel exposure is realized. Please see the attached letter "Management of Contaminated Soil from Nonremediation Activities at the Hanford Site" for more complete information.

Soil removed from the investigation points for this project may be controlled during sampling activities and then returned to the boreholes. Any plastic, wipes, etc., which are generated during this work scope which can't be released for disposal must be retained and packaged as radioactive waste.

For further information concerning packaging or management of this waste, please contact me.

Mr. Michael A. Wilson Program Manager Nuclear Waste Program State of Washington Department of Ecology P.O. Box 47600 Olympia, Washington 98504-7600

Dear Messrs. Bussell and Wilson:

MANAGEMENT OF CONTAMINATED SOIL FROM NONREMEDIATION ACTIVITIES AT THE HANFORD SITE

In a letter from the State of Washington Department of Ecology (Ecology) and the U.S. Environmental Protection Agency (EPA) entitled "Proposed Site Policy for Management of Contaminated Soil," dated September 14, 1994, to the U.S. Department of Energy, Richland Operations Office (RL) it was proposed that appropriate staff from RL and the above agencies work together to reach agreement on substantive elements of a contaminated soils management policy. Staff from these agencies have been meeting with representatives of RL and RL contractors to resolve contaminated soil issues and reach agreement on a practical, workable policy. Ecology was designated the Lead Regulatory Agency.

The policy described in this letter is the result of that joint effort and will be implemented immediately on the Hanford Site. Your formal response and agreement on the policy is requested.

<u>Purpose:</u> The purpose of this policy is to define a consistent approach at the Hanford Site for managing contaminated soil encountered during excavation activities.

The contaminated soil policy is relatively simple. In most cases, it is expected that contaminated soil encountered during excavation activities will be returned to the site of the original excavation at the conclusion of the activity. While awaiting return to the ground, contaminated soil will be managed in a manner to prevent the spread of contamination. Management of contaminated soil will be conducted so as to be protective of human health and the environment. -2-

Messrs. Bussell and Wilson 96-EAP-186

JUL 02 1936

<u>Scope:</u> The premise for this policy is that, as representatives from EPA and Ecology have agreed, excavation activities are considered to be normal earth moving and grading activities which are not considered "placement," are not considered waste treatment, storage, or disposal, do not trigger requirements found in the Land Disposal Restrictions, and are not subject to any generator requirements. For environmental remediation (ER) activities, the proper disposition of contaminated soil is generally described in the appropriate decision documents. However, for excavation activities not associated with remediation where final cleanup is not the objective, such as excavation for routine maintenance, common trenching for pipeline installation, or excavation for building foundation construction, there has been no sitewide policy for proper disposition of contaminated soil. This policy applies to soils displaced during noremediation excavation activities.

Contaminated soil will not be returned to its original excavation if such action would create As Low As Reasonably Achievable (ALARA) concerns. Management of contaminated soil must avoid significant adverse impacts to exposure pathways to humans and the environment. For example, creating significant surface contamination at a site that was previously uncontaminated would have an adverse impact on exposure pathways and would preclude return of the soil to ground. Management of contaminated soil will not be allowed to create unacceptable exposure of radiological or hazardous chemical constituents to workers, the public, or environmental receptors.

Potential occupational exposures to hazardous substances and radiological substances during excavation activities are minimized by adhering to requirements in Hanford Site industrial safety programs and the Hanford Site Radiological Control Manual (HSRCM-1). Industrial safety programs prescribe the use of appropriate field monitoring instruments when there is a reasonable possibility of exposing an employee to hazardous substances at concentrations or levels in excess of published occupational exposure standards. As discussed in HSRCM-1, Radiation Work Permits are used to control the entry into radiation and contamination areas. The details of monitoring and surveys for radiation, contamination, and airborne radioactive materials are specified in these work permits.

As part of the contaminated soil policy, it is important for the Hanford Site contractor conducting excavation activities to communicate excavation and soil management plans with the Hanford Site remediation contractor. Management of contaminated soil cannot be allowed to adversely impact current or future remediation of an operable unit. Excavations and management of contaminated soil will be coordinated with the environmental remediation contractor to avoid adverse impacts to remediation activities. When soil contamination is discovered during an excavation activity, the contractor responsible for the excavation will be responsible for documenting this contamination in the Waste Information Data System. Information in this database will be used by the -3-

Messrs. Bussell and Wilson 96-EAP-186

JUL 0 2 1996

The contaminated soil policy does not apply to current spills or unpermitted discharges of dangerous wastes or hazardous substances. In these cases, the source of the spill needs to be identified, the unpermitted discharge stopped, and the spill site remediated, as necessary, per the requirements of the Washington Administrative Code, Section 173-303-145(3). Soil cleaned up during remediation of an active spill site cannot be returned to ground.

Contaminated soil that cannot be returned to its excavation site will be considered waste, will be properly designated, and will be managed in accordance with all applicable regulations. For those waste soils that are designated as dangerous waste due to the contained-in policy, RL may elect to request a determination from Ecology that the contaminated soil no longer contains dangerous waste when the concentrations of dangerous waste constituents in the soil are below specific health-based levels. Such "contained-in determinations" will be requested on a case-by-case basis. Along these lines, RL encourages Ecology to adopt the Hazardous Waste Identification Rule, with its concentration-based exit levels for certain listed wastes, as soon as possible once the rule is finalized.

In summary, it is expected that most contaminated soil displaced during excavation activities will be returned to the ground in the general vicinity of the original excavation. ALARA concerns may preclude returning excavated soil directly to ground, in which case the contaminated soil would be managed as any other waste generated on the Hanford Site.

Should you have any questions on this matter, please contact Felix Miera of my staff, on (509) 373-7589, or Eric Greager of WHC Environmental Services Division, on (509) 376-3132.

Sincerel

D - Compound concentration resulted from a dilution.

U - The analyte was analyzed for but not detected.

Z - See Comments,

J - Estimated value.

MDL=Minimum Detection Limit

RQ=Result Qualifier

B - The analyte was detected in the associated method blank. E - Compound concentration exceeded calibration range.

- N Identification is based on a mass spectral library search.
- * Indicates results that have NOT been validated.

ဌန္မ

MDL=Minimum Detection Limit RQ=Result Qualifier B - The analyte was detected in the associated method blank. D - Compound concentration resulted from a dilution. E - Compound concentration exceeded calibration range. J - Estimated value. Z - See Comments. N - Identification is based on a mass spectral library search. U - The analyte was analyzed for but not detected.

* - Indicates results that have NOT been validated. W004
